

AI Dermatology & Oncology Center

Advanced Computer-Aided Diagnostic Laboratory • Clinical Evaluation Report

Patient Name: John Doe	Report ID: AI-DERM-2026-9042
Age / Gender: 35 / Male	Date: September 5, 2026
Modality: Dermoscopic Deep Learning (EfficientNetB0)	Source: HAM10000 Dataset Benchmark

1. Submitted Lesion & Explainable AI (SHAP) Attribution

The visual attribution map highlights localized pixel regions (pigment networks and structural asymmetry) that heavily influenced the deep learning classification decision.

Original Lesion Input

SHAP Attribution Heatmap

2. Diagnostic Classification & Clinical Reasoning

Primary Prediction Code:	df
Full Clinical Diagnosis Name:	Dermatofibroma
Confidence Score:	41.88%

Clinical Interpretation: The EfficientNet convolutional neural network analyzed border structure, pigment dispersion, and lesion asymmetry. Based on learned pattern extraction matching benchmark dermatology repositories, the sample has been categorized as a **Dermatofibroma** with a confidence rating of 41.88%.

3. Clinical Disclaimer

This document is generated by an artificial intelligence diagnostic assistant for research and evaluation purposes. It does not replace professional dermatological evaluation, physical dermoscopy, or histopathological biopsy.
